

Secure Remote Access for Legacy Applications

Central Access for Legacy Mainframe, CRM & ERP Applications

Still need to access legacy applications? Looking to eliminate the time and expense of managing a disparate application stack for this access? AEP Series A Secure Application Access offers a centralised point of access for legacy applications: mainframe applications, CRM and ERP application stacks such as SAP, Sybase & Oracle. IT support teams manage one central appliance instead of numerous desktops and applications. With mainframe access, remote users can instantly access mainframe applications and print locally from any location, over any Internet connection (dial-up, DSL, cable modem, satellite or Wi-Fi).

Series A leverages a company's existing IT infrastructure investment with a clientless, fast-to-deploy appliance-based solution that reduces the configuration, installation, distribution, and administrative resources normally associated with more complex middleware alternatives. The result is an integrated solution that delivers a fast ROI while significantly reducing initial and ongoing IT support costs.

Key Capabilities

Legacy Application Access: Series A provides secure, remote access to applications residing on legacy mainframe servers as well as CRM and ERP application stacks such as SAP, Sybase and Oracle.

Universal Application Access: One unit delivers secure, controlled access to mixed application environments (mainframe, Microsoft, Citrix, UNIX) presented to users in a single web page containing familiar application icons.

3270 Scripting: Provides the same scripting advantages users expect when working with mainframe applications in the office. Create custom scripts to simplify a user's mainframe experience by eliminating repetitive tasks.

Keyboard Mapping: Provides keyboard mapping, a useful utility common to the mainframe environment. Assign functions to keyboard combinations, letting users assign a single keystroke to perform routine tasks.

Security Features

SSL encryption for secure connections.

Strong, two-factor authentication support (RSA, VASCO—built in server).

Application Layer Proxy— Applications remain safe on the server and are never directly exposed to the public network.

Device Fingerprinting — Limits access to pre-approved client devices.

No new firewall ports – SSL traverses standard https ports already open for Web traffic.

Layered Authentication — Flexible, V-realm framework combines numerous protocols: RSA SecurID®, LDAP, Windows® NT®, RADIUS, Windows Active Directory, Kerberos, ActivCard (Smart Cards), and more.

FIPS 140-2 Level 4 option — Security at the highest FIPS level.
